

Project 4
Dog Information Application
CIS 436 - Dr. Baugh - 04/27/2022

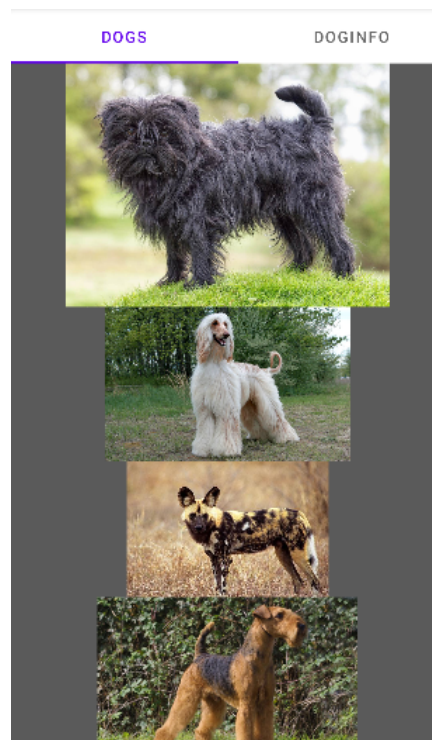

Bailey Helfer
Christopher Hill
Cody Lovelace

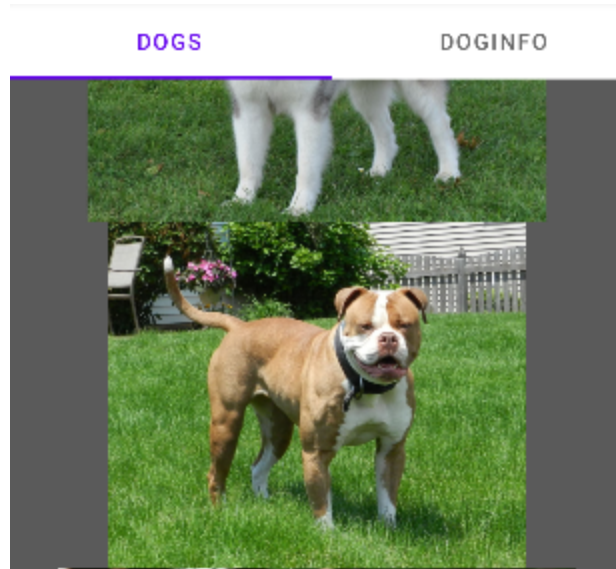

Description Of Project

The application we created is very useful for finding out information about your favorite kinds of dogs! The way our application works is that we have two tabs that are separated into two separate fragments. Our first tab, DOGS is a list of images containing different dog breeds. Upon clicking on the image of the dog you will then be sent to our other tab DOGINFO which will display some information about the dog like its breed, lifespan and also its temperament. From here you can click back to the DOGS tab and click on any other dog image in the scroll view.

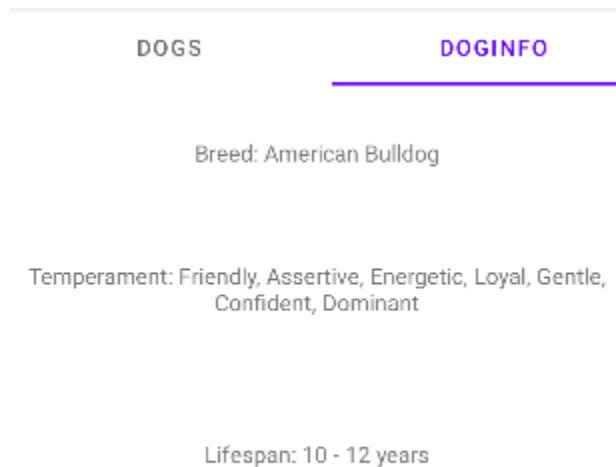

Application Screenshots and Flow of User Experience

Upon loading the application, the user is greeted with a scrollView full of adorable dogs!

Once satisfied with a dog of their choosing, the user can select the image to receive information about that animal. Once an image is selected, the user is sent to the DOGINFO tab for that particular breed.

The textViews of DOGINFO display the name of the dog's breed, its temperament and its average lifespan. DOGS and DOGINFO tabs can be navigated between by the user at any time to return to previously populated information without selecting another image.
